
Storage read traffic = bytes fetched from storage (demand fetches + prefetches) during epochs 1–2 of the REAL CosmoFlow demand timeline in the trace-driven SIMULATION; epoch 0 (cold start) is not counted. The cache is LRU with window protection; prefetched data is pinned until its use. 1 GB = 10^9 bytes; the 61,440-file dataset is 178 GB (166 GiB); epochs 1–2 read every file once = 356 GB.
